GEORGETOWN UNIVERSITY

OUTLINE

1. Introduction

- The problem of heat dissipation in magnetic actuation
- Converse magneto-electric actuation: mechanisms
- Magneto-ionics

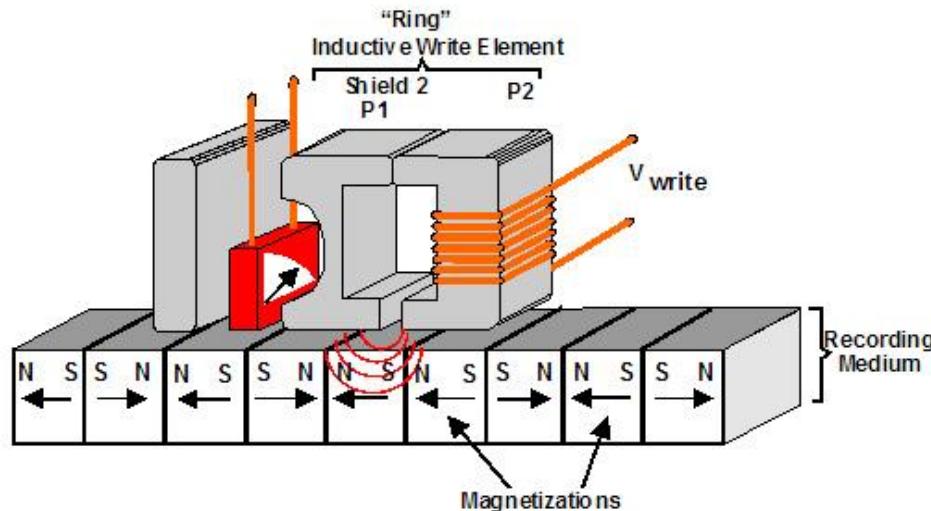

2. Results and discussion

- Magneto-ionic effects in Co_3O_4 films
 - ✓ Morphology and structural characterization
 - ✓ Magnetic properties vs. applied voltage: ON-OFF magnetism!
 - ✓ Effect of the electric field configuration
- Extrapolation to other materials: N-magneto-ionics

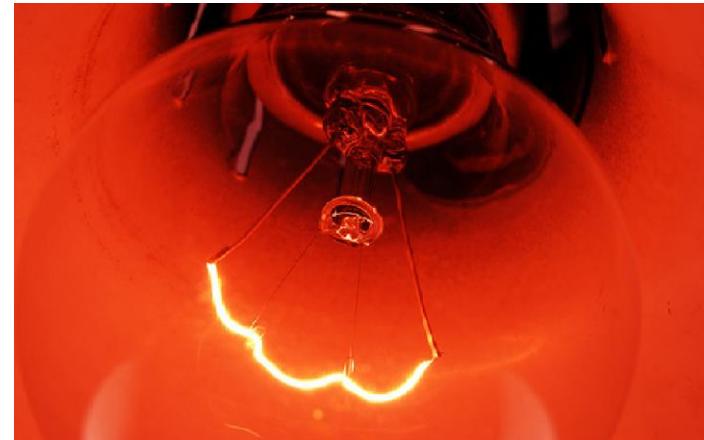

3. Conclusions

1. INTRODUCTION

1. INTRODUCTION: POWER DISSIPATION IN MAGNETIC RECORDING

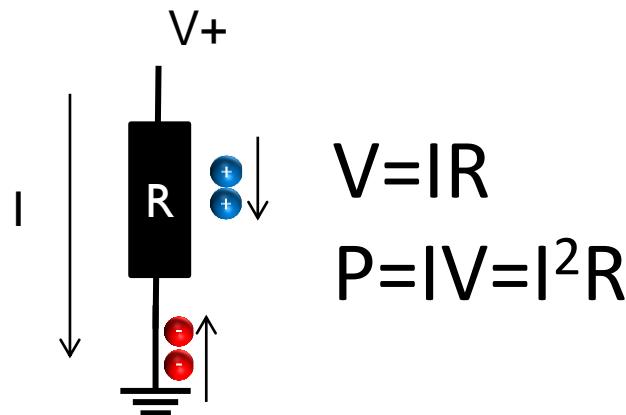

© 2005, Hitachi Global Storage Technologies

Joule Effect

- Almost **40%** of electric power can be **wasted due to heat dissipation!**

1. INTRODUCTION: POWER DISSIPATION IN MAGNETIC RECORDING

Microsoft is throwing data centers underwater

Technology | Thu Oct 27, 2011 6:30am EDT

Facebook likes Sweden for first Europe server site

STOCKHOLM

Social networking site Facebook is to build its first data center outside the United States in the northern Swedish town of Luleå, awarding an initial construction contract of \$121 million, the companies said on Thursday.

The data center, set to be the largest of its kind in Europe, will take advantage of the climate in Luleå, among the coldest in Sweden, to cool tens of thousands of servers.

"Those servers basically are what allow us to support all of the Facebook products for our users. Friend requests, tags, user updates will be accessed through this facility," Tom Furlong, Facebook's director of site operations, told Reuters.

"It will mostly serve European users and ideally improve performance for them," he added in a telephone interview.

1. INTRODUCTION: POWER DISSIPATION IN MAGNETIC RECORDING

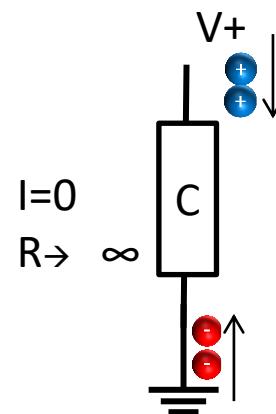

What can be done to avoid power dissipation?

- Try to replace current by DC voltage.
- Move from **resistive** to **capacitative** systems.

$$V = IR$$
$$P = IV = I^2 R$$

Resistive System

$$P = IV = V^2/R$$
$$P = 0$$

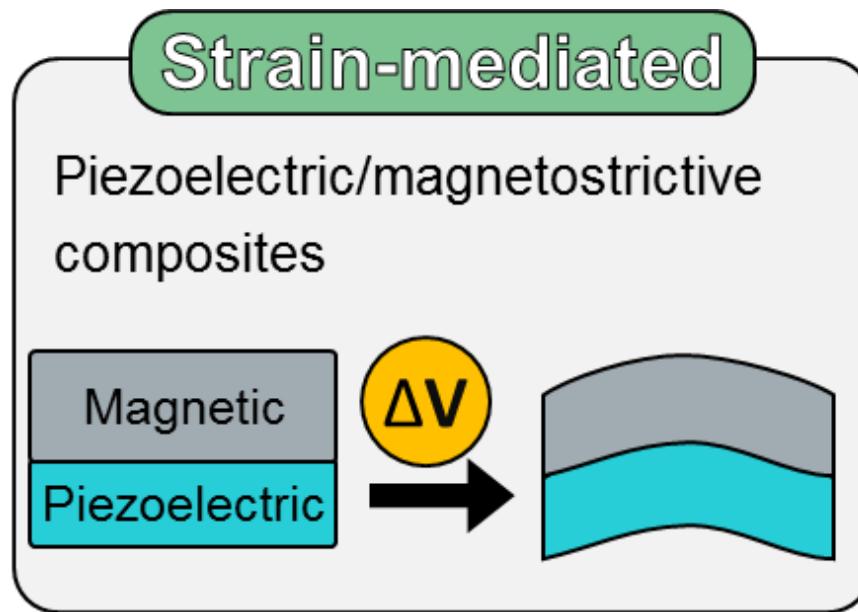

Capacitive system

- But... is it possible to **control magnetism with voltage**?

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

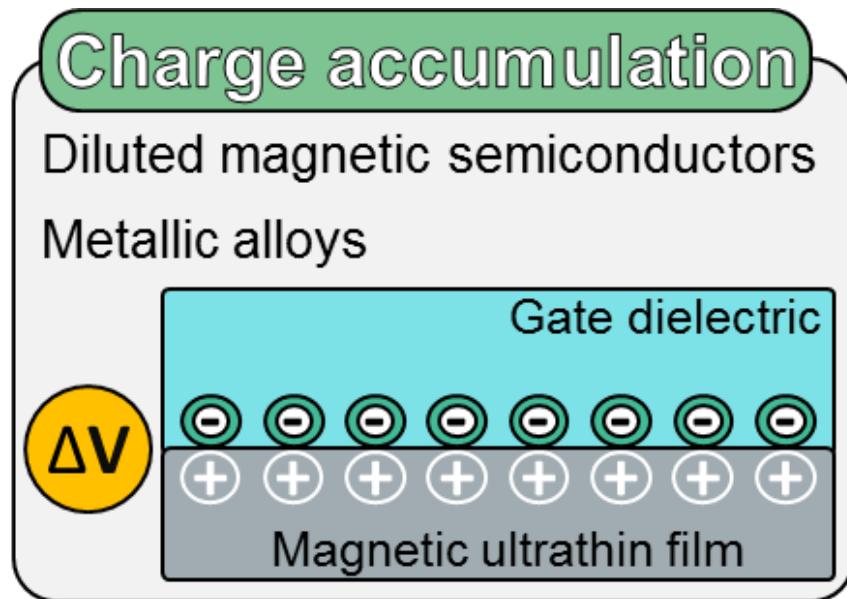

➤ Conventional voltage-driven magnetic actuation approaches

- ✗ Strain mediated piezoelectric + magnetostrictive composites (clamping effects, need of epitaxy, fatigue-induced failure)
- ✗ Single phase multiferroics (basically at low T)

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

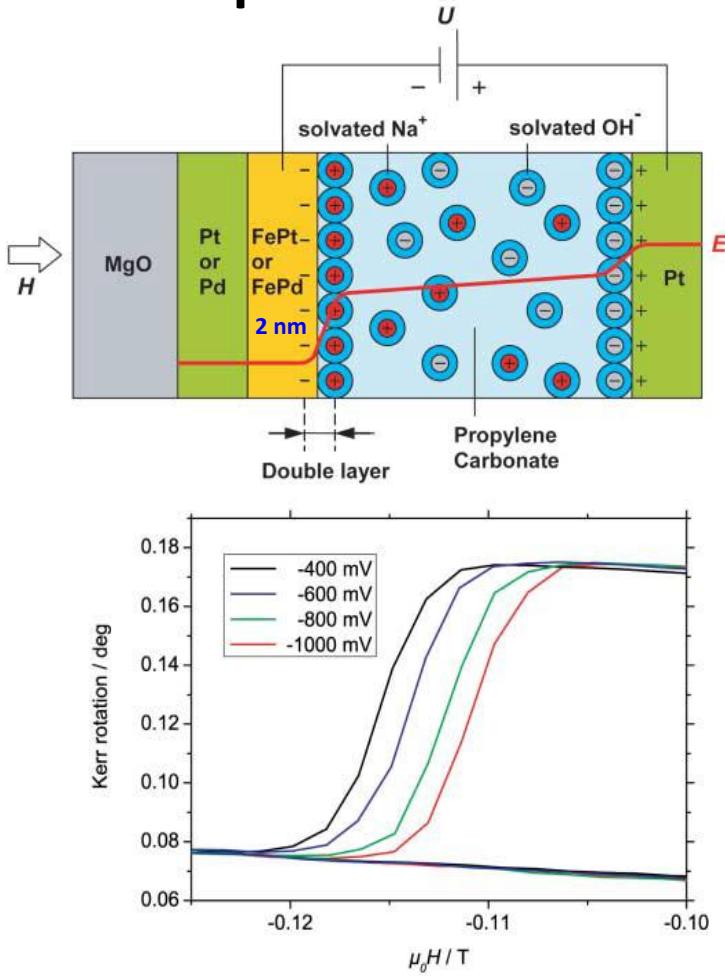

- Magnetism mediated by electrostatic charges (voltage-driven)
- ❖ Typically proven in:
 - i) Low-T magnetic semiconductors
 - ii) Metallic **ultra-thin films** and nanoparticles (electric field only at the surface!)

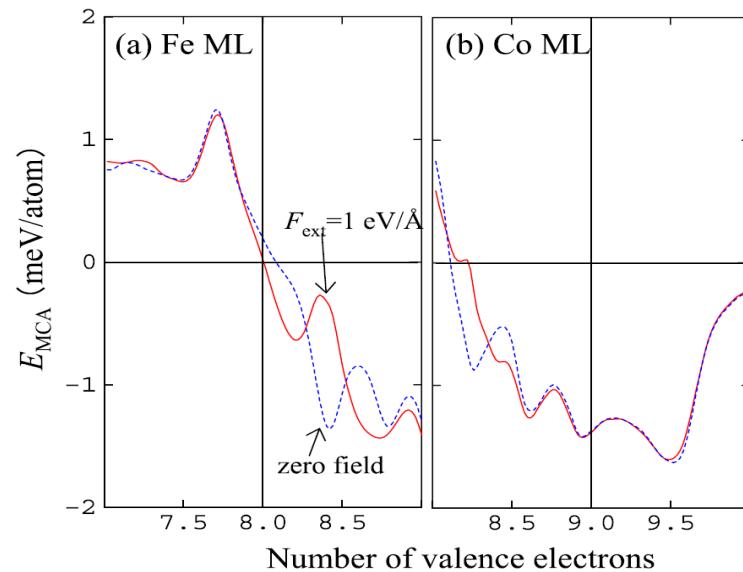

In metals $\lambda_{TF} = 0.5 \text{ nm}$! Effects within the exchange length ($l_{ex}=20 \text{ nm}$)

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

➤ Some previous works in ultra-thin films (electrostatic charging)

M. Weisheit, *Science* 315 (2007) 349.

K. Nakamura, *Phys. Rev. Lett.* 102 (2009) 187201.

➤ Voltage induces changes in the **electronic band structure**

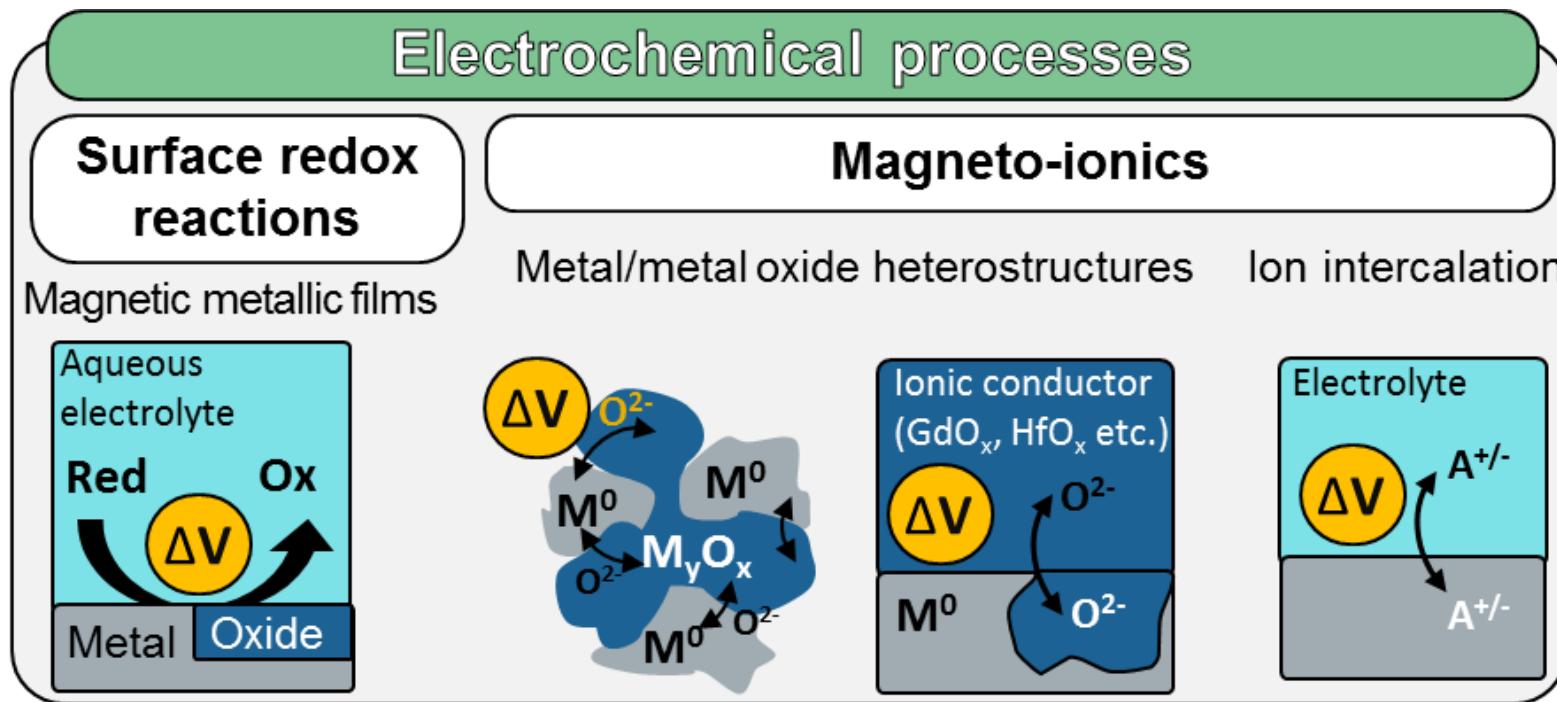

➤ Coercitivity **lowers by 4,5%**!

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

➤ Magnetism mediated by voltage-driven ion migration (magneto-ionics)

- ❖ Strongest non-volatile effects (permanent changes)
- ❖ Usually slow at room temperature (ionic conductivity is thermally activated)

Nat. Mater. 14 (2015) 174

Nat. Commun. 11 (2020) 5871
APL Mater. 7 (2019) 030701

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

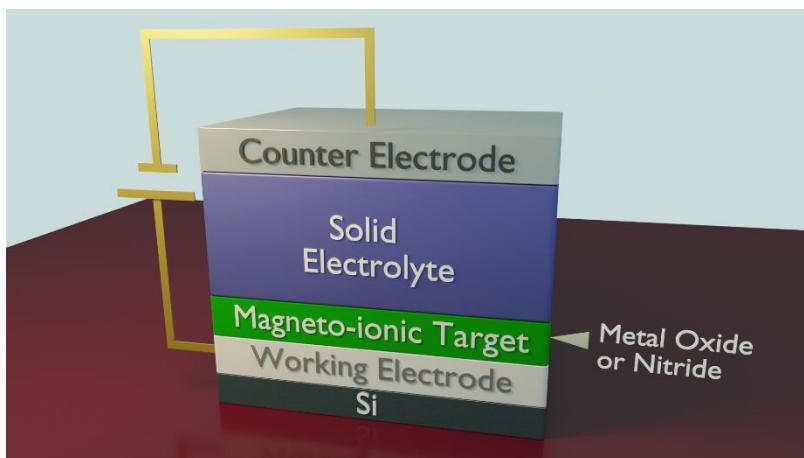

Magneto-ionics = modulation of oxidation state by voltage-induced ion motion (**O, Li, H, F and N ions**)

System = Layered heterostructure containing a magneto-ionic target

Ways to apply voltage (DV):

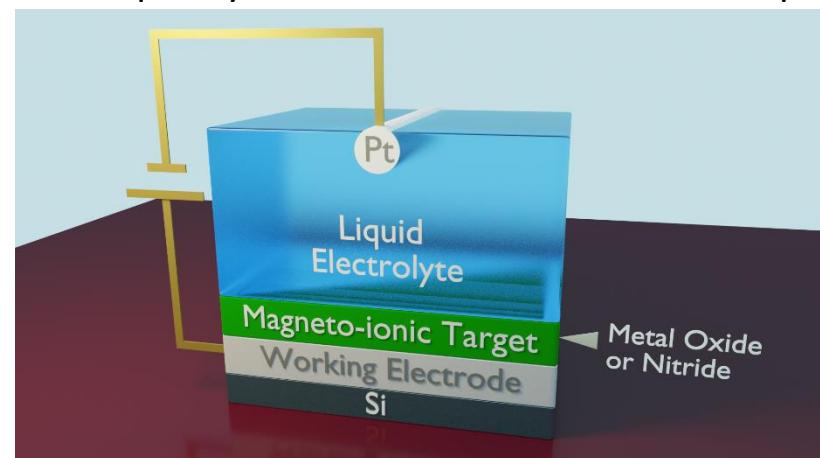

Solid electrolytes

all-solid systems: solid heterostructure/solid

Liquid electrolytes

solid/liquid systems: solid heterostructure/liquid

Nat. Mater. **14** (2015) 174
Nat. Mater. **18** (2019) 35
Nano Lett. **20** (2020) 3435

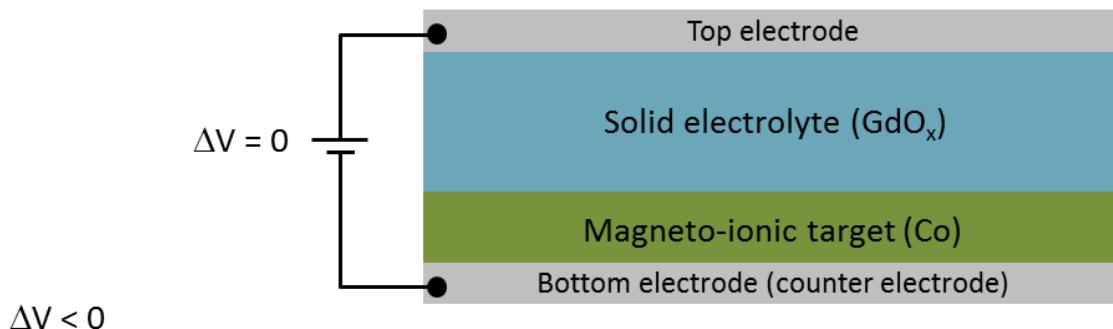

Adv. Funct. Mater. **27** (2017) 1701904
ACS Nano **12** (2018) 10291
APL Mater. **7** (2019) 030701

Electrolyte = ion reservoir to donate/accept (O, Li, H, F and N) ions depending on voltage polarity

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

Oxygen magneto-ionics using all-solid layer heterostructures: thin ferromagnetic layers (Co, Fe...) grown adjacent to solid electrolytes (GdO_x , HfO_2 ...)

Condenser-like configuration

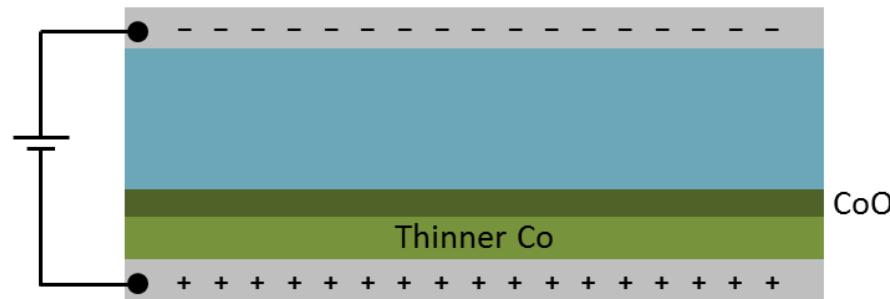

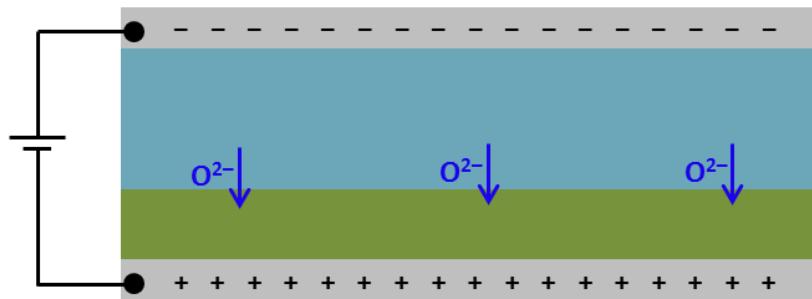

$\Delta V < 0$

Nat. Mater. 14 (2015) 174
Phys. Rev. B 98 (2018) 214441
Nat. Mater. 18 (2019) 35

In-plane magnetic anisotropy

→ Magnetization

Out-of-plane magnetic anisotropy

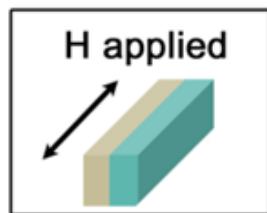

↑ Magnetization

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

Voltage actuation by **electrolyte-gating** (liquid electrolytes: e.g., non-aqueous propylene carbonate with Na^+)

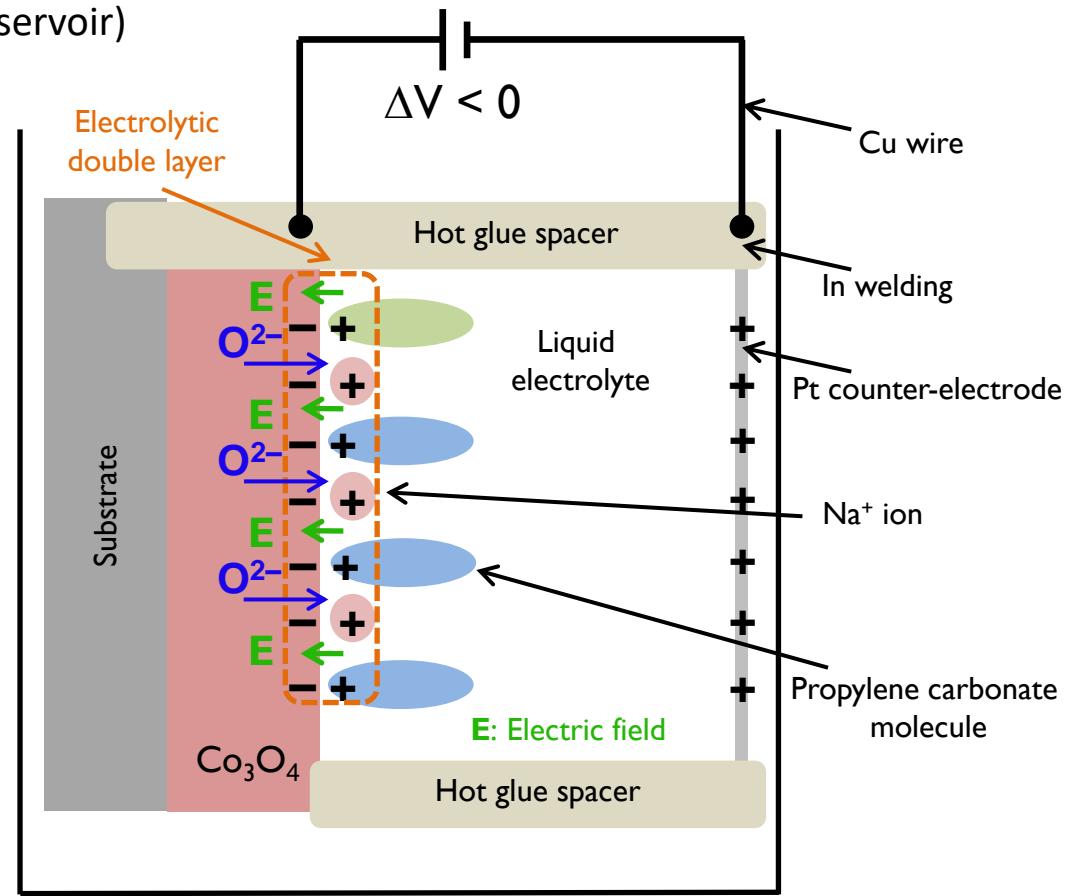

Propylene carbonate can dissolve oxygen (reservoir)

- Electrolytic cell adaptable to VSM holder

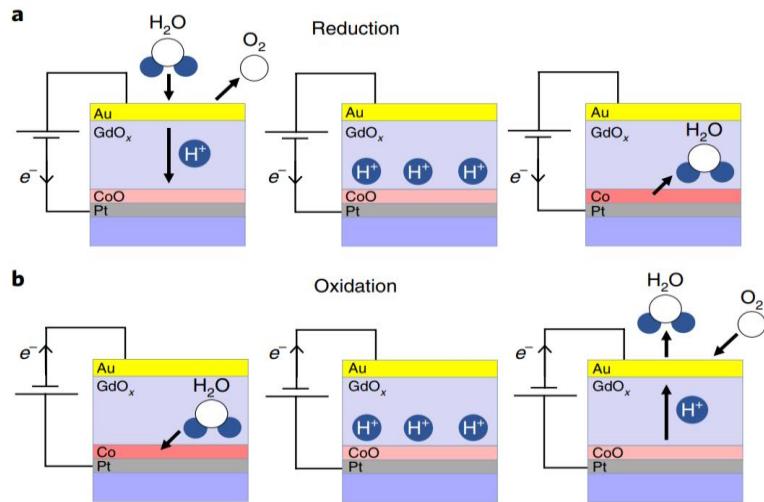

Why in liquid state?

- To ensure proper V actuation through the formation of an **electric double layer (EDL)**, with no pinholes
- To obtain **high electric field with low or moderate voltages** (thickness of EDL < 1 nm)

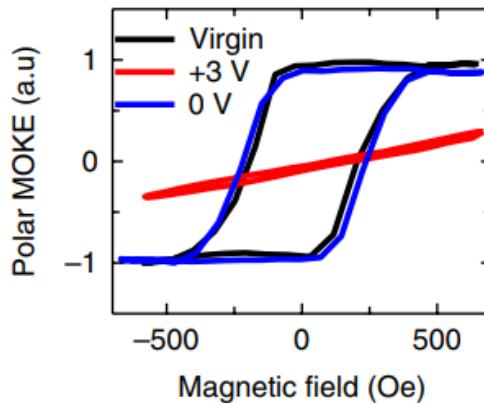

1. INTRODUCTION: MAGNETO-ELECTRIC ACTUATION

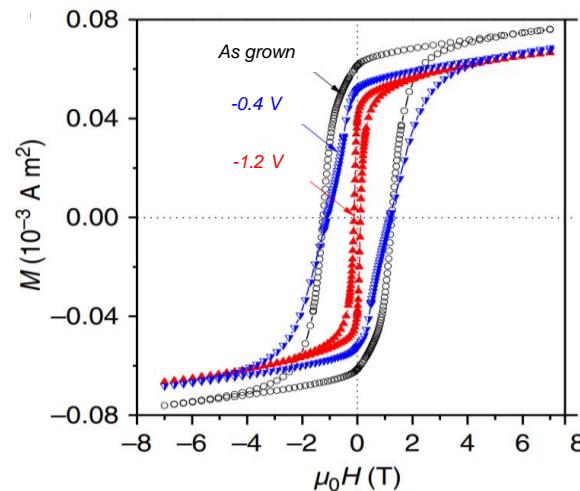

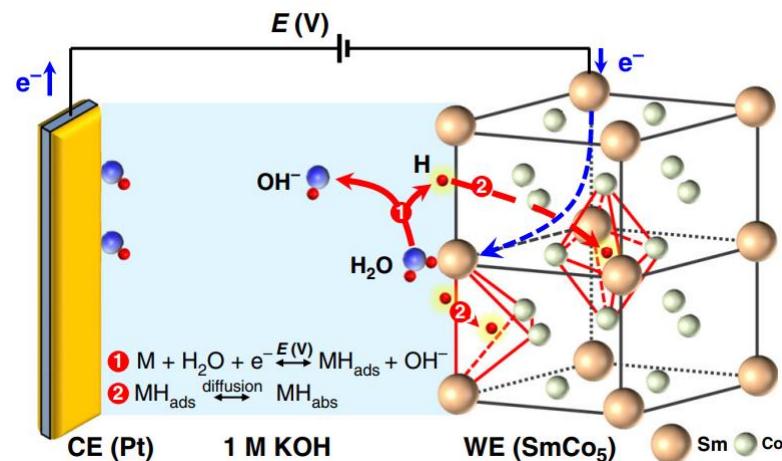

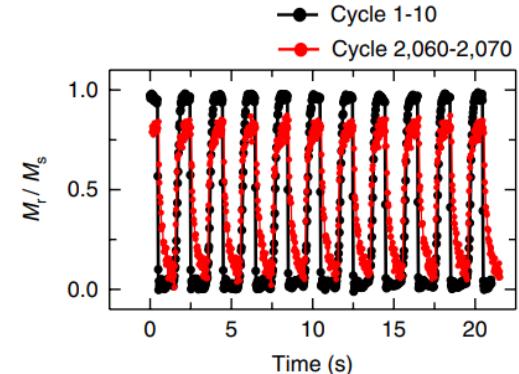

Hydrogen (H^+) magneto-ionics gives faster and **very strong effects!**

Nat. Mater. 18 (2019) 35

SOLID configuration

LIQUID configuration

Nat. Commun. 11 (2020) 4849

2. RESULTS & DISCUSSION

3. RESULTS AND DISCUSSION: ON-OFF magnetism in Co_3O_4 dense films ?

Voltage-driven motion of structural oxygen ions: the case of Co_3O_4

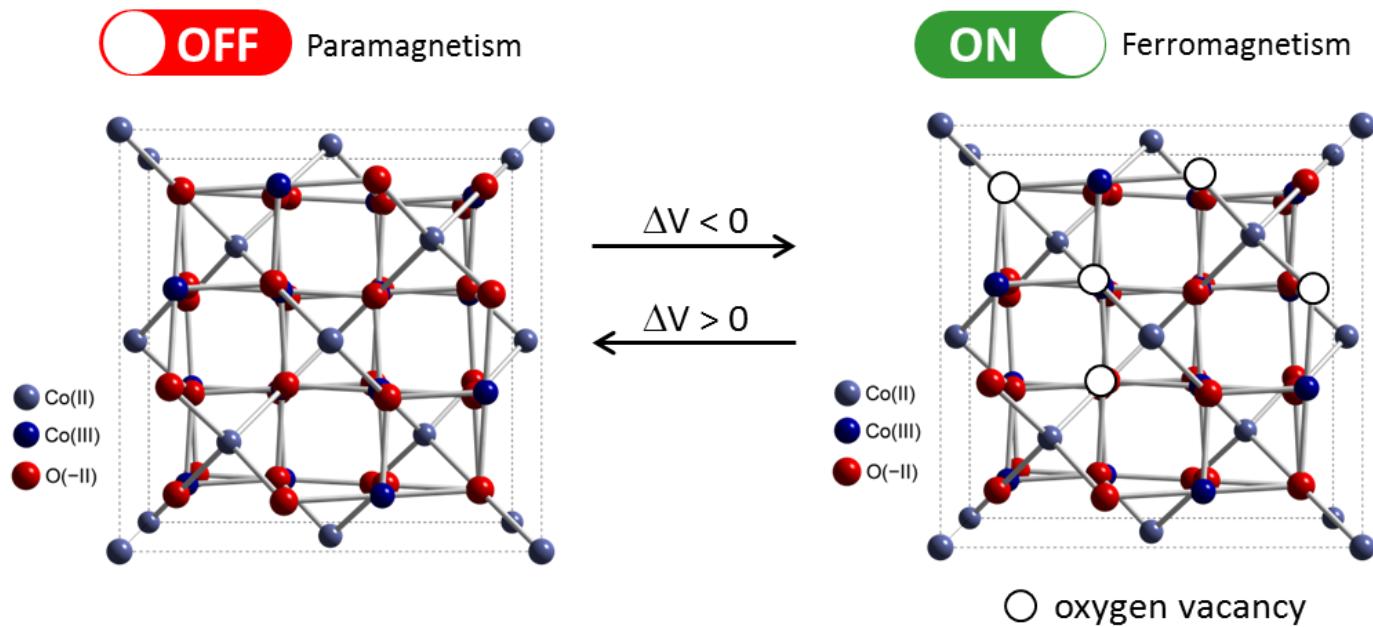

- OFF-ON-OFF... (OFF: paramagnetism & ON: ferromagnetism) ??

- Spinel structure

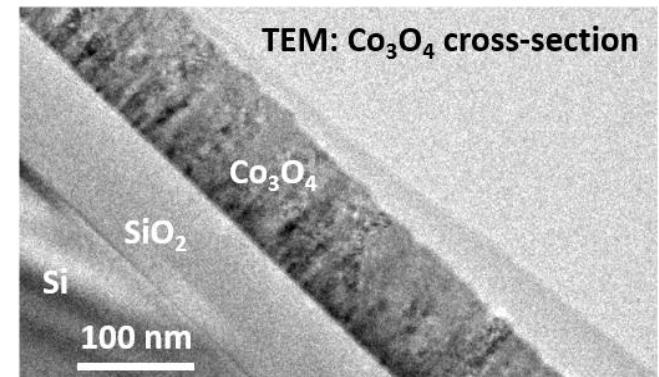

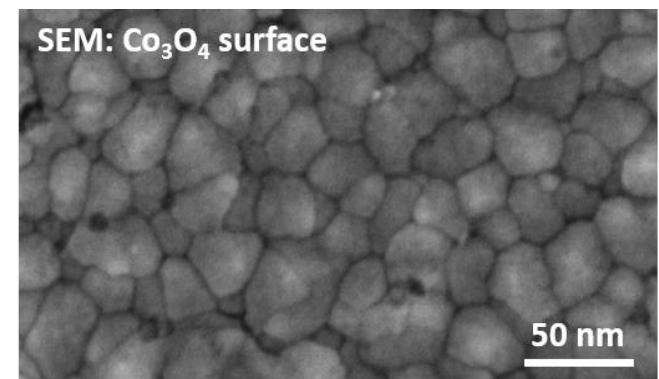

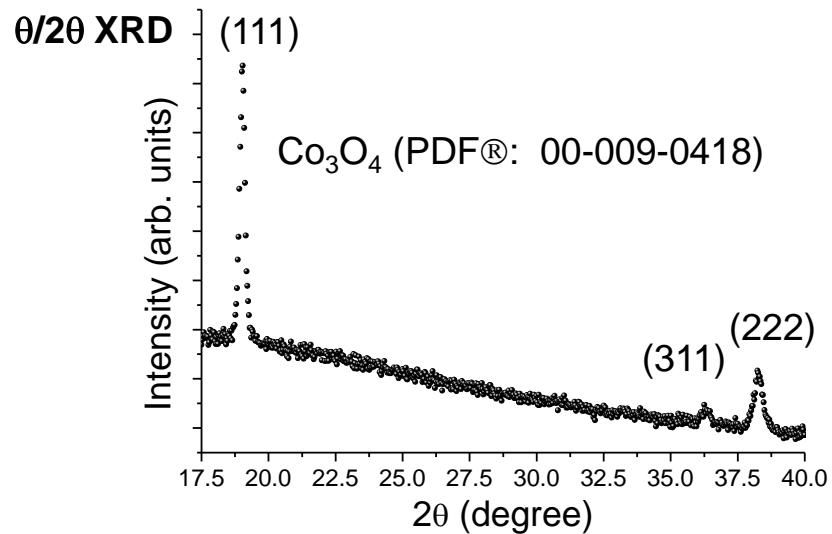

Co_3O_4 (spinel structure)

$a = 8.0840 \text{ \AA}$

(PDF®: 00-009-0418)

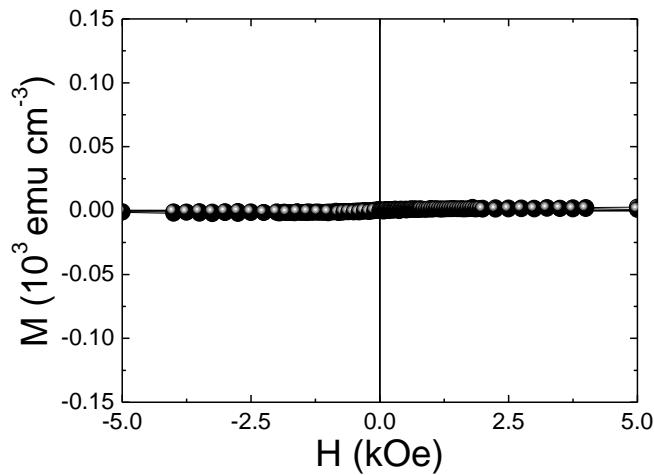

3. RESULTS AND DISCUSSION: ON-OFF magnetism in Co_3O_4 dense films ?

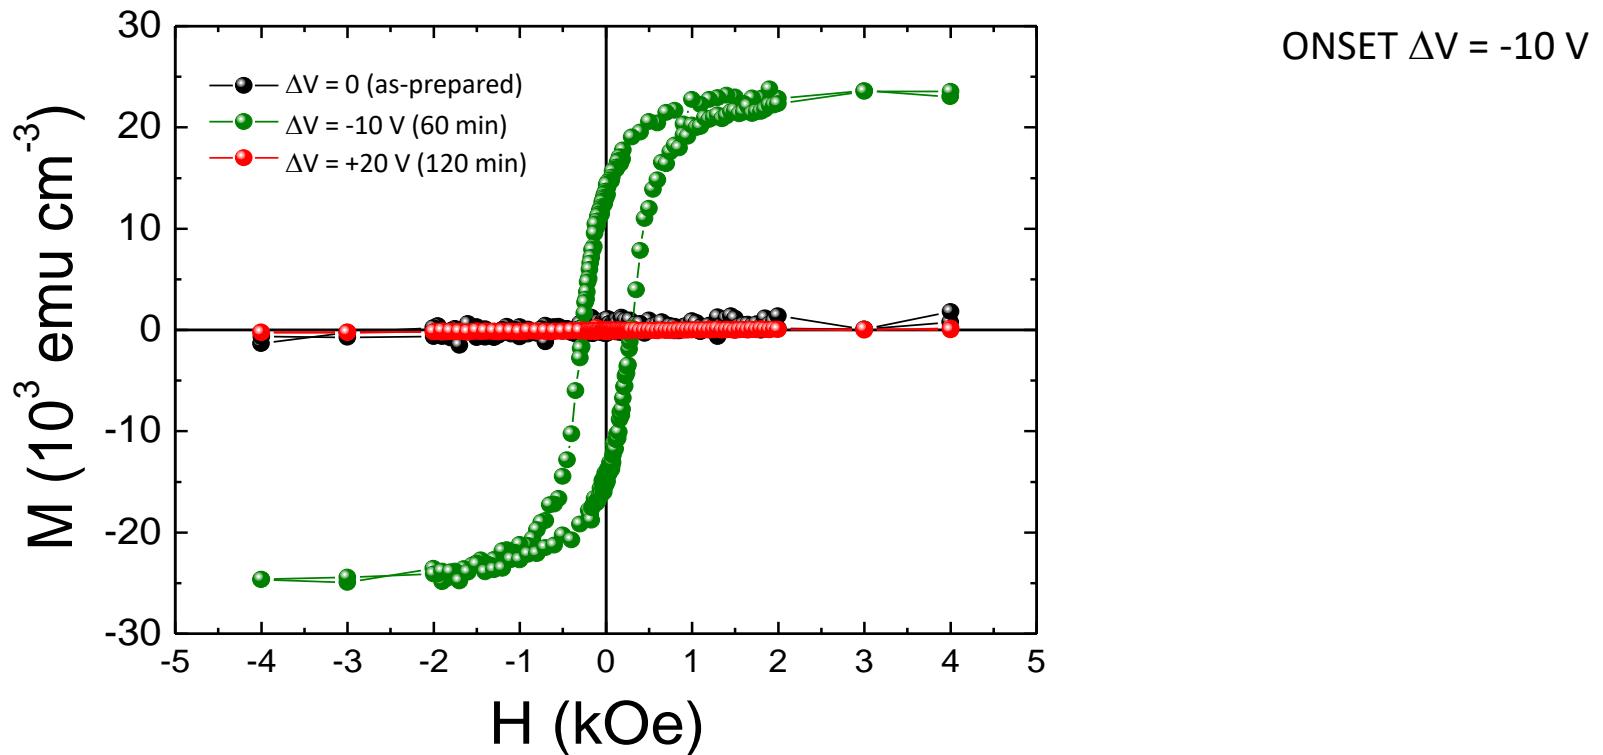

M vs. H dependence

Non-ferromagnetic
(OFF)

≈ 100 nm-thick Co_3O_4 thin films
by atomic layer deposition on
thermally-oxidized [100]-oriented
Si (100 nm-thick SiO_2/Si)

3. RESULTS AND DISCUSSION: Magneto-ionic effects in Co_3O_4 dense films

Full reversibility for mild voltages and moderate times

ACS Nano 12 (2018) 10291
Adv. Funct. Mater. 30 (2020) 2003704

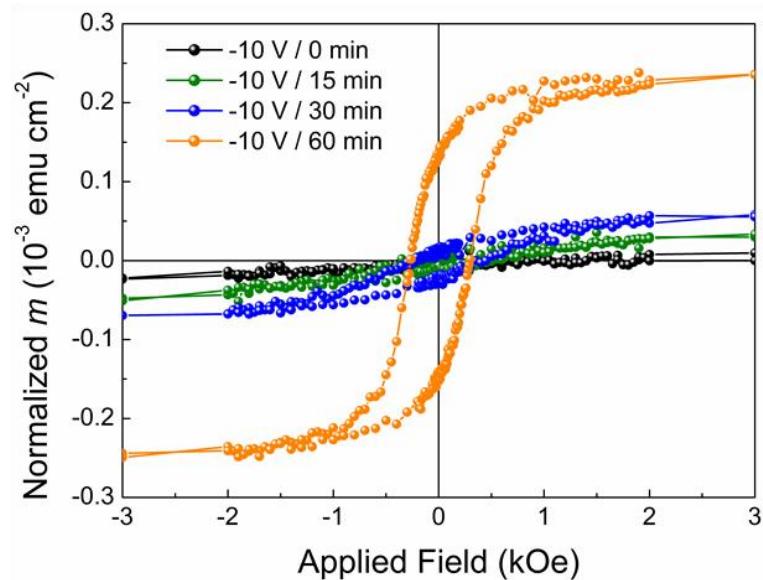

Magnetic switch

$\Delta V < 0$ (ON) Ferromagnetism

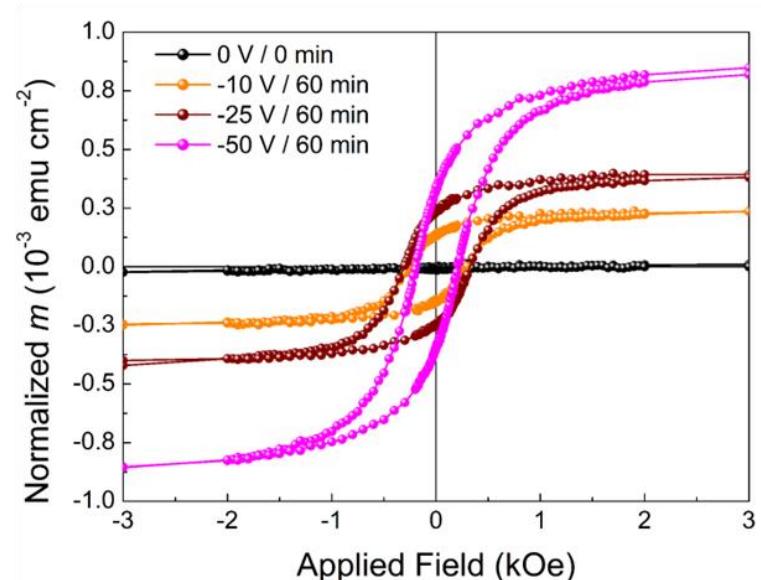

$\Delta V > 0$ (OFF) Paramagnetism

3. RESULTS AND DISCUSSION: Magneto-ionic effects in Co_3O_4 dense films

Magnetoelectric measurements by vibrating sample magnetometry

m scales with time

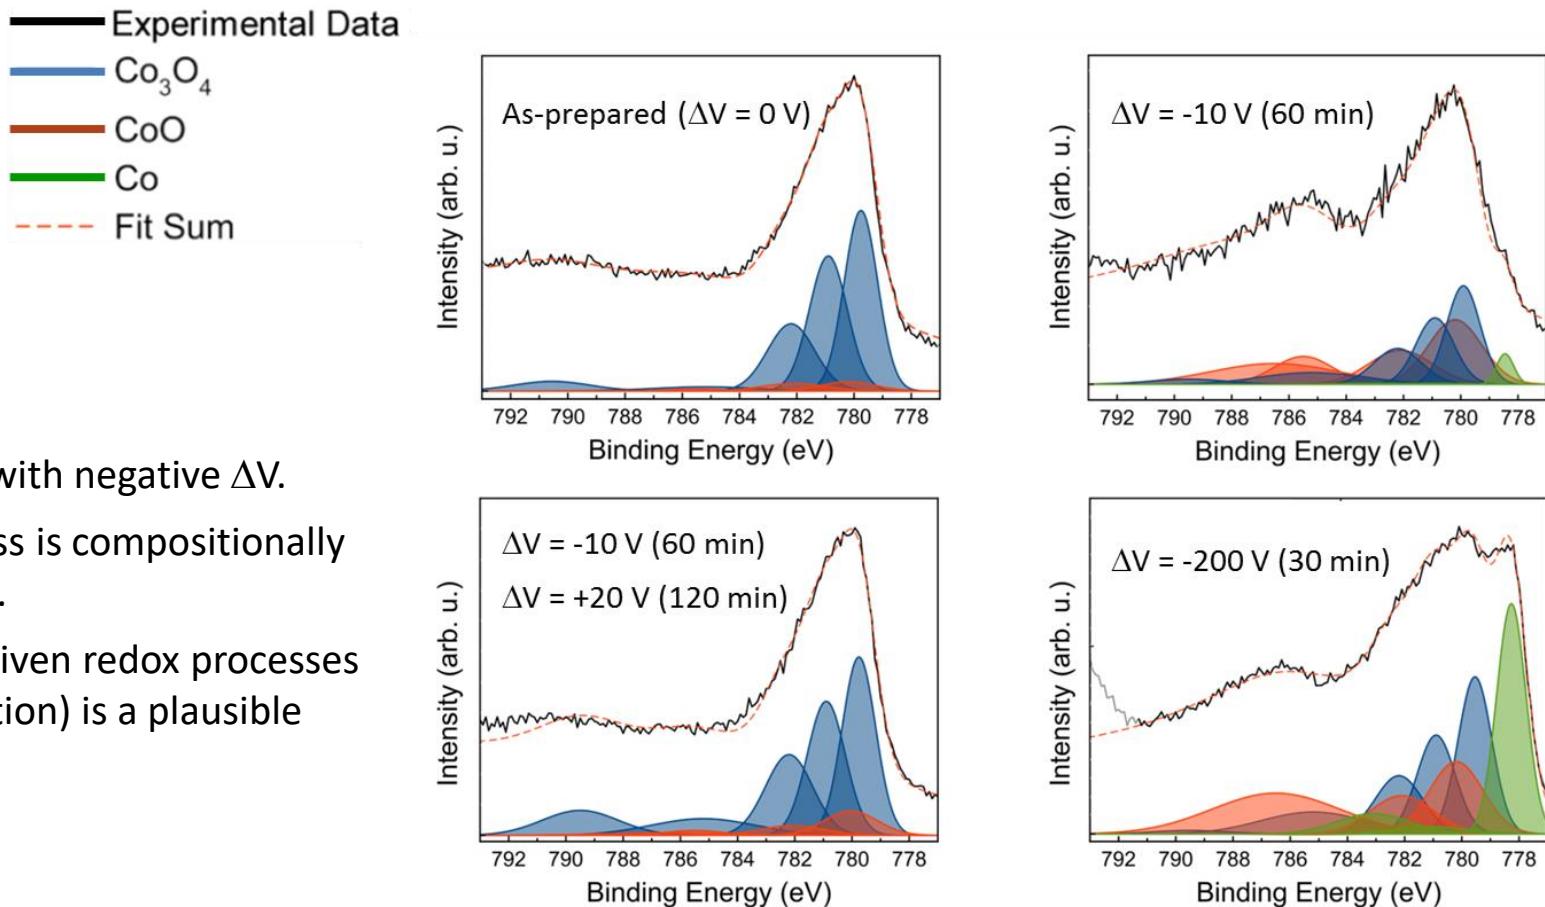

m scales with negative ΔV
(voltage-activated effect)

m ($-50 \text{ V} / 60 \text{ min}$) is equivalent to a metallic 6 nm-thick Co film (assuming FCC-Co, 164.8 emu/g, 8.9 g/cm 3)

3. RESULTS AND DISCUSSION: Structural characterization

- What is happening from a compositional viewpoint? (XPS analysis)

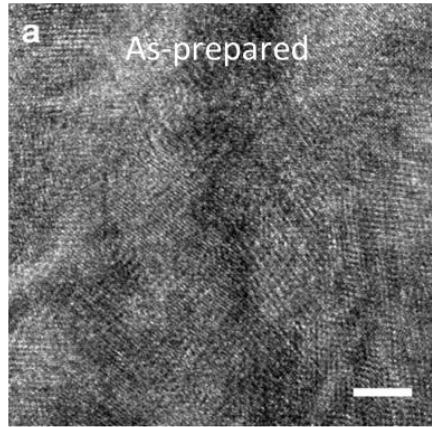

- Co scales with negative ΔV .
- The process is compositionally reversible.
- Voltage-driven redox processes (O^{2-} migration) is a plausible scenario.

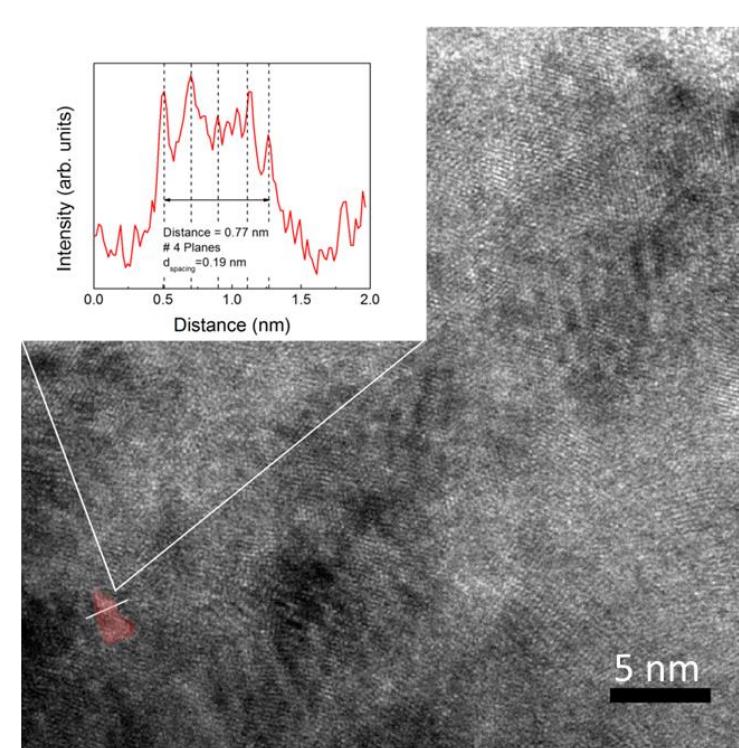

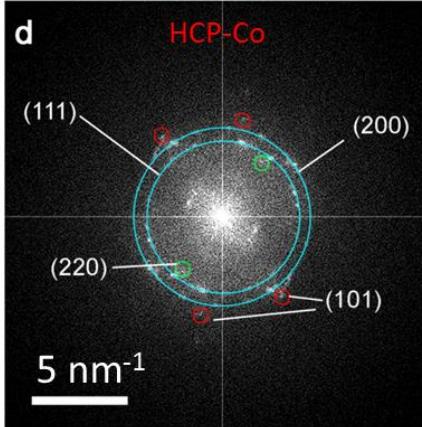

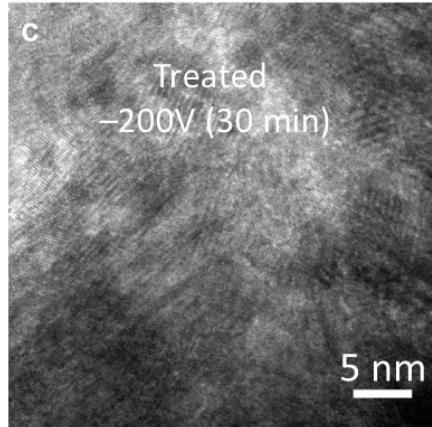

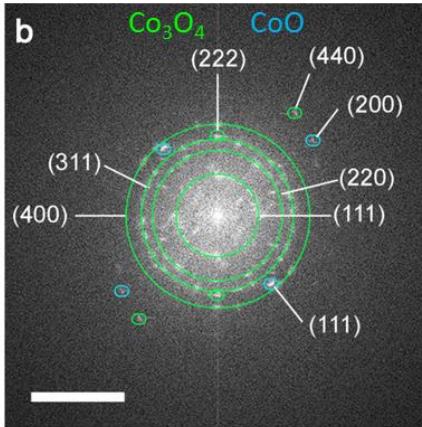

3. RESULTS AND DISCUSSION: Structural characterization

What is going on from a structural point of view?

HRTEM

FFT

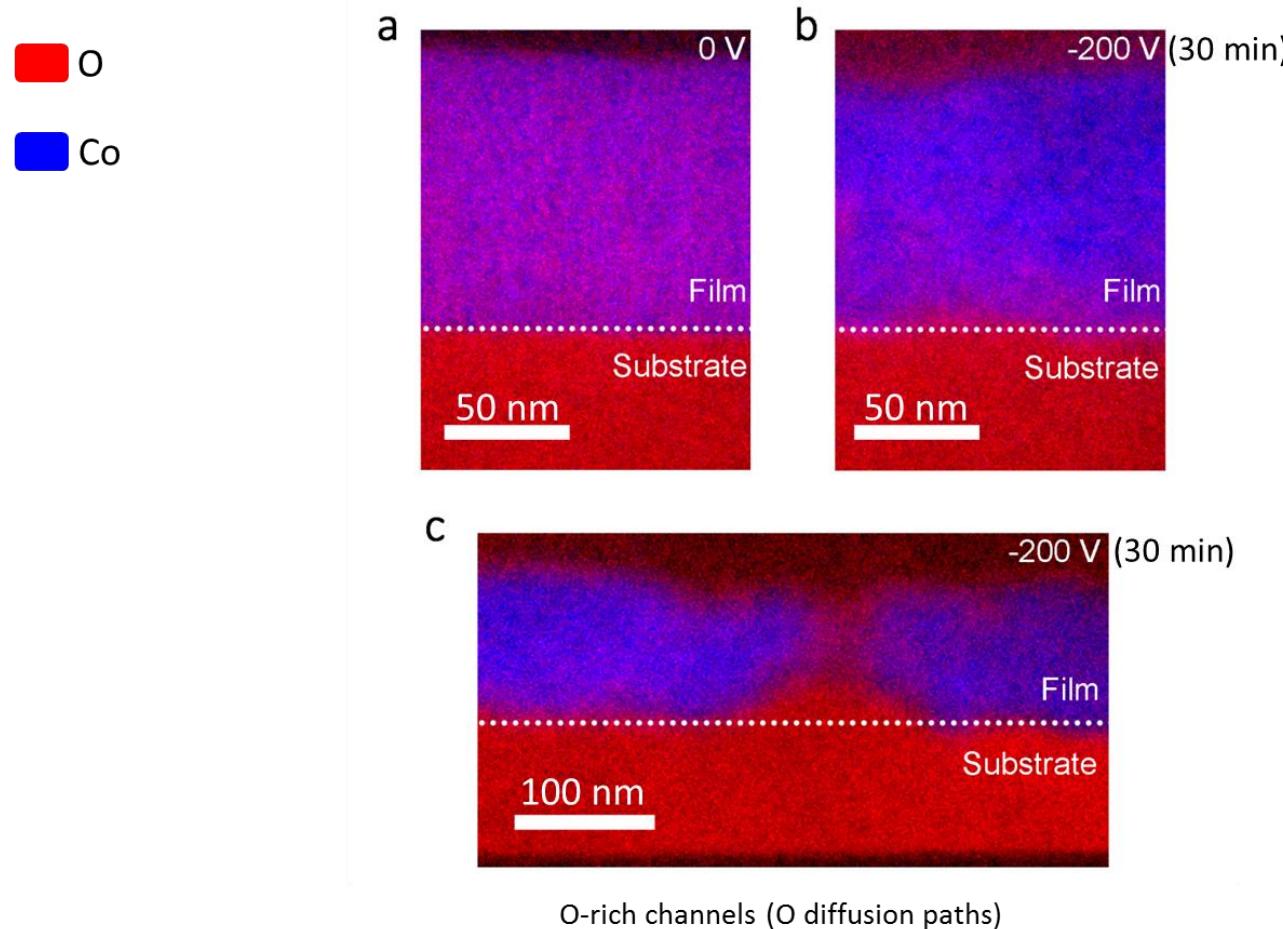

HRTEM → HCP-Co nanocrystals

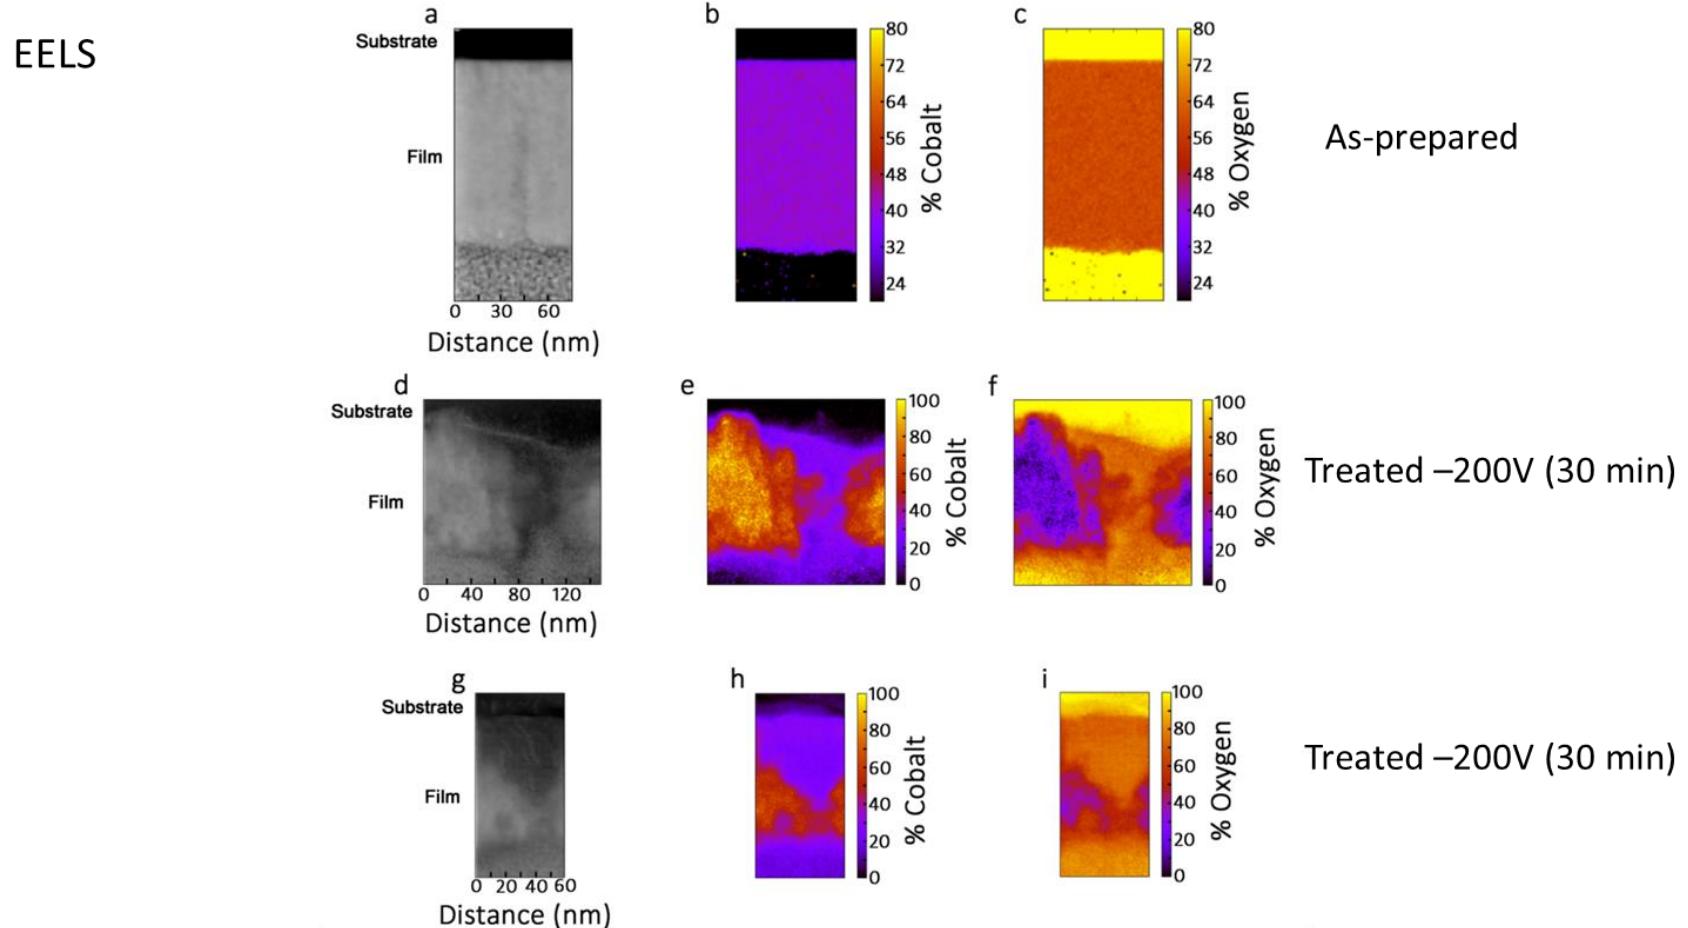

3. RESULTS AND DISCUSSION: compositional characterization

Further compositional and structural insights:

EFTEM

3. RESULTS AND DISCUSSION: compositional characterization

- O-rich channels (diffusion paths which allow for a large incorporation of O due to lack of crystallinity)
- Not only O migration! Co and O ion migration (segregation)

3. RESULTS AND DISCUSSION: in-depth structural characterization

Ion migration mechanism:

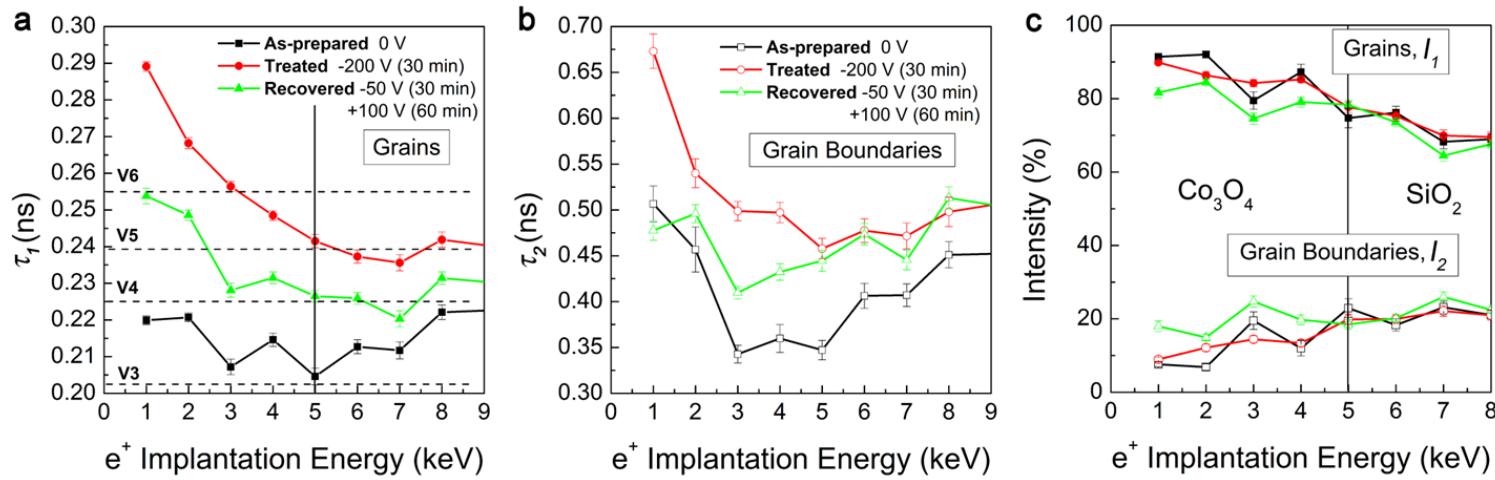

PALS (Positron Annihilation Lifetime Spectroscopy)

To disentangle size and density
("τ" accounts for defect size and "Intensity" for defect density)

- τ_1 (< 0.30 ns): vacancy clusters inside the grains ✓
- τ_2 (0.35 < τ_2 < 0.70 ns): grain boundaries ✓
- τ_3 (1.50 < τ_3 < 4.00 ns): large voids (1-3 nm in diameter) ✗

A. Quintana et al., ACS Nano 12 (2018) 10291.

3. RESULTS AND DISCUSSION: in-depth structural characterization

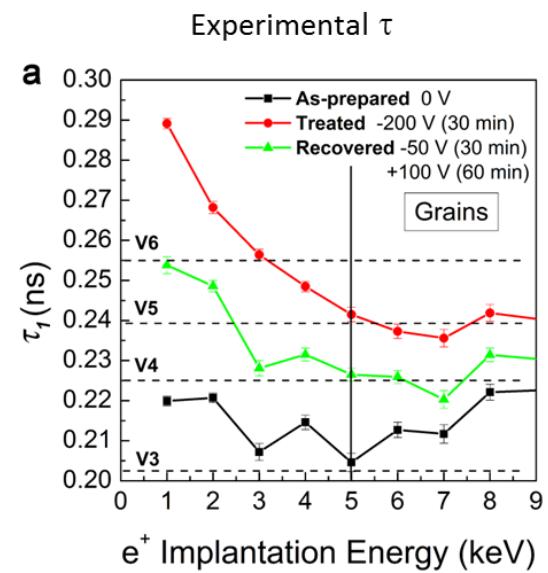

Ion migration mechanism:

Calculated positron lifetimes τ using the atomic superposition (ATSUP) method

Co_3O_4	No. of vacancies within a complex	Vacancy type	Positron lifetime τ (ns)
Co vacancy clusters	0	-	0.1188
	1	V_{Co} (monovacancy)	0.1646
	2	$V_{2x\text{Co}}$ (dimer)	0.1757
	3	$V_{3x\text{Co}}$ (trimer)	0.1785
O vacancy clusters	4	$V_{4x\text{Co}}$	0.1795
	1	V_{O} (monovacancy)	0.1201
	2	$V_{2x\text{O}}$ (dimer)	0.1255
	3	$V_{3x\text{O}}$ (trimer)	0.1347
Mixed vacancy clusters	2	$V_{\text{Co}} + V_{\text{O}}$	0.1816
	3	$V_{\text{Co}} + V_{2x\text{O}}$	0.1952
	3 (V3)	$V_{2x\text{Co}} + V_{\text{O}}$	0.2030
	4 (V4)	$V_{3x\text{Co}} + V_{\text{O}}$	0.2251
	5 (V5)	$V_{3x\text{Co}} + V_{2x\text{O}}$	0.2394
	6 (V6)	$V_{3x\text{Co}} + V_{3x\text{O}}$	0.2526

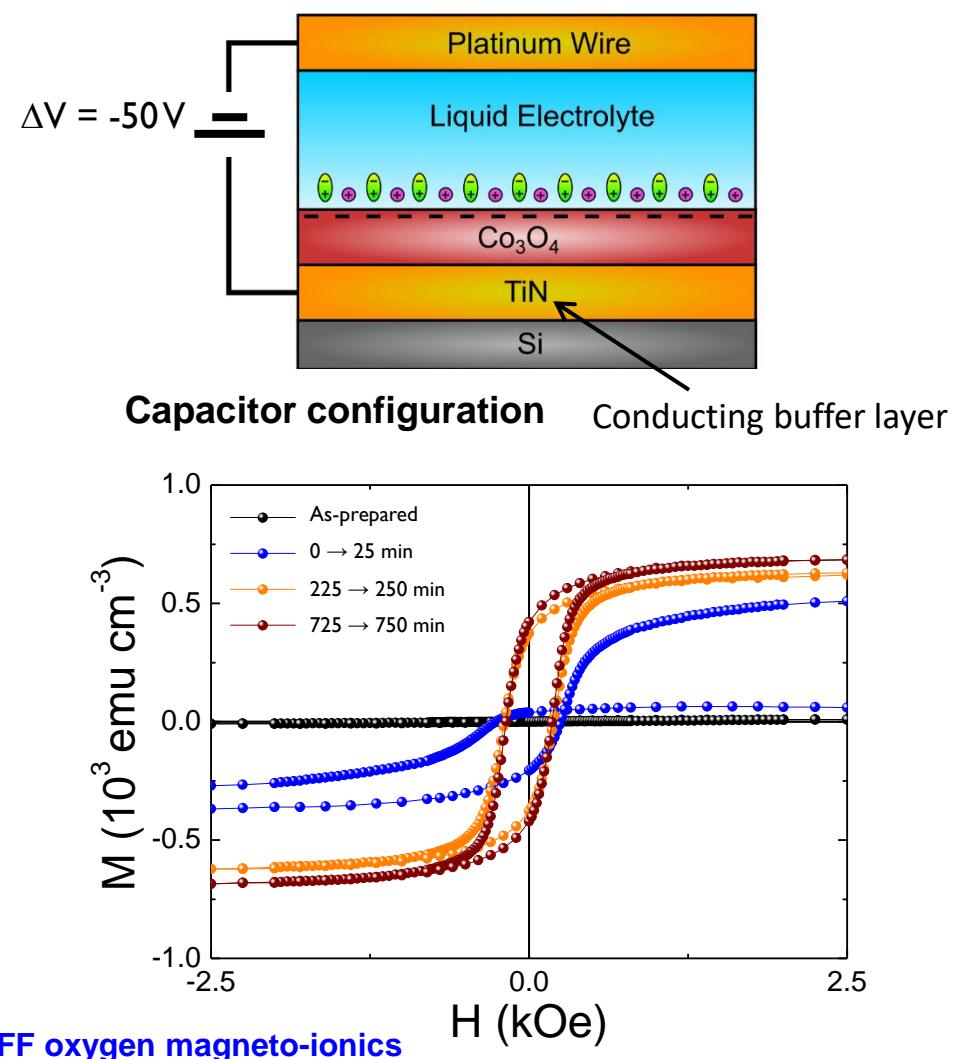

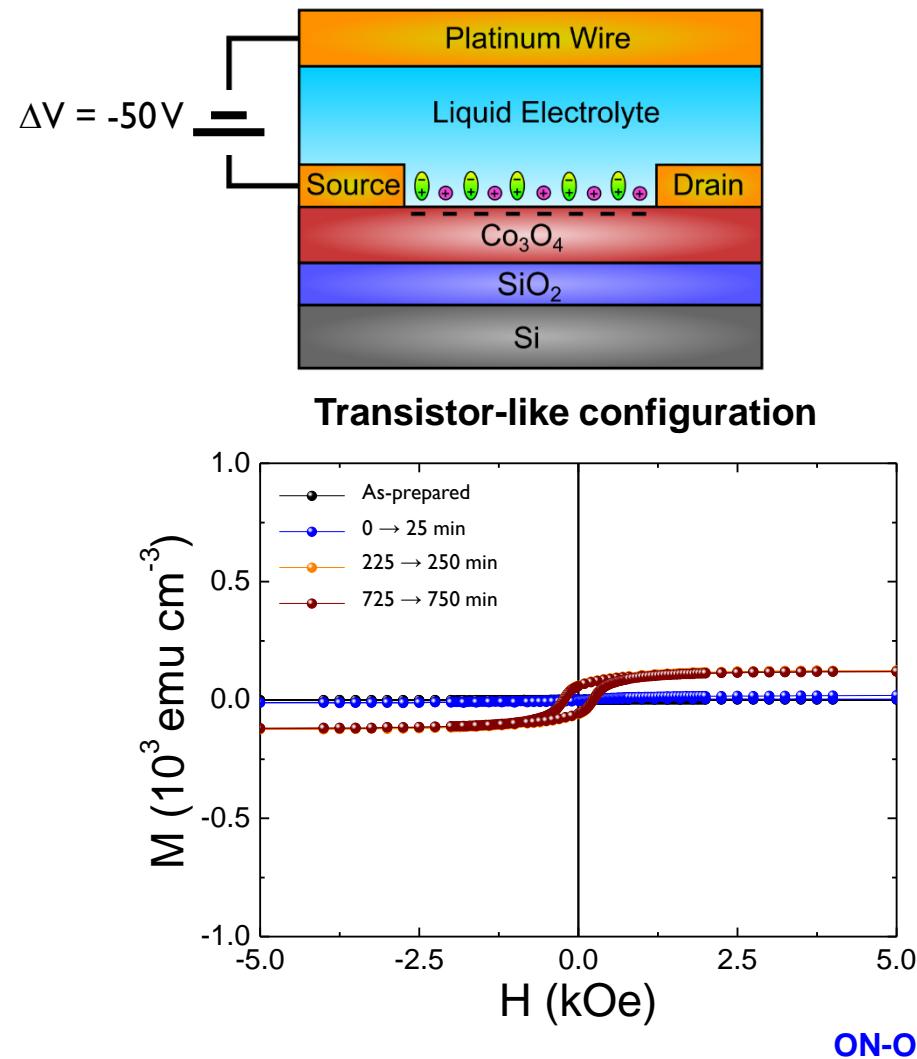

J. Olsen et al. *Phys. Status Solidi C* 4 (2007) 4004

A. Quintana et al., *ACS Nano* 12 (2018) 10291.

- Only mixed vacancy clusters are compatible with the experimental results!
- Not only O migration! Co and O ion migration

3. RESULTS AND DISCUSSION: Influence of the electric field configuration

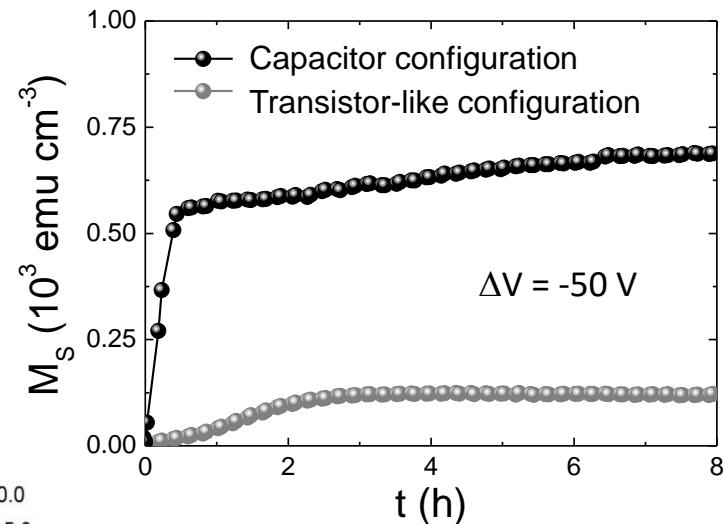

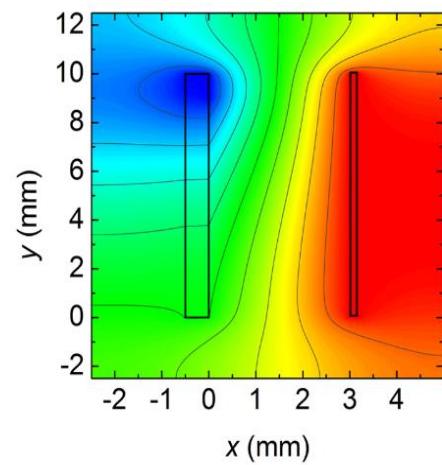

3. RESULTS AND DISCUSSION: Influence of the electric field configuration

Transistor-like configuration

Ion motion rate $\approx 30 \text{ emu cm}^{-3} \text{ h}^{-1}$

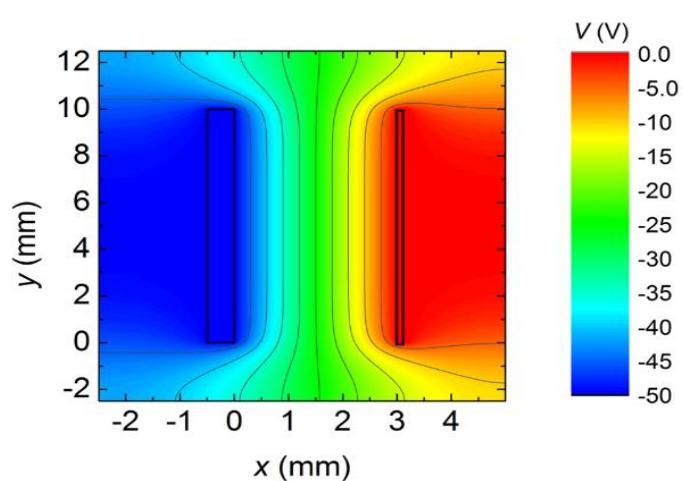

$M_s(t \rightarrow \infty) \approx 120 \text{ emu cm}^{-3}$

Capacitor configuration

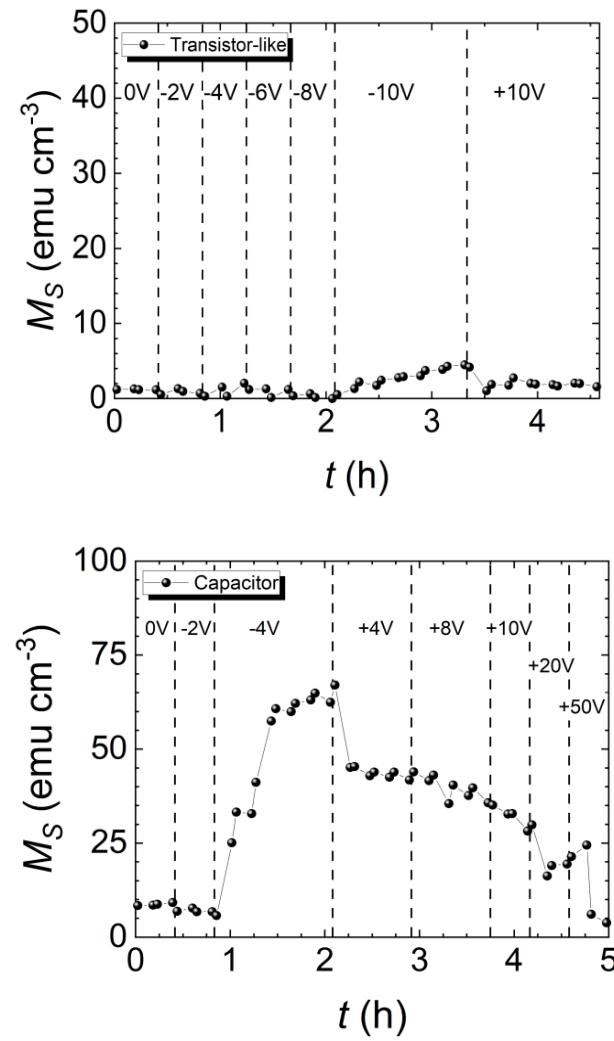

Ion motion rate $\approx 1200 \text{ emu cm}^{-3} \text{ h}^{-1}$

$M_s(t \rightarrow \infty) \approx 700 \text{ emu cm}^{-3}$

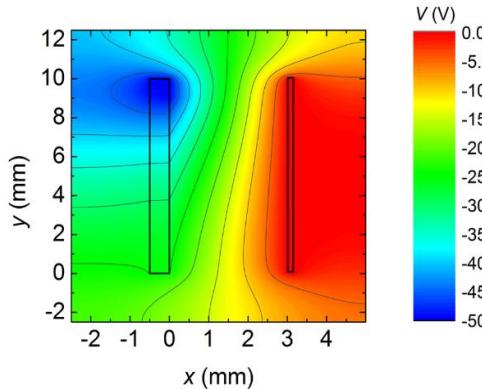

Adv. Funct. Mater. 30 (2020) 2003704

3. RESULTS AND DISCUSSION: Influence of the electric field configuration

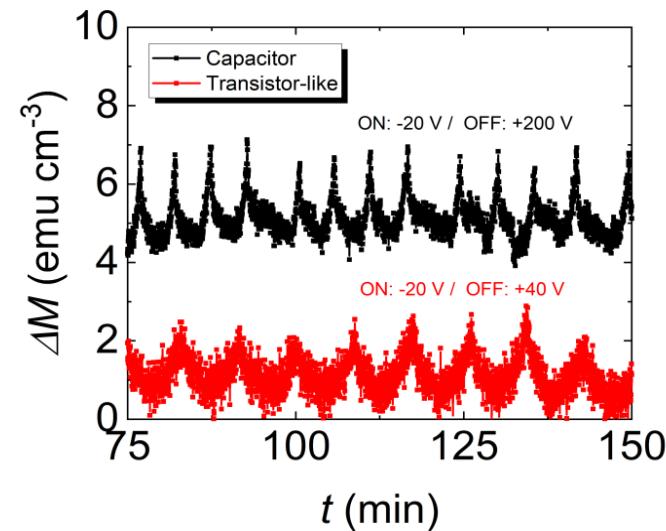

Transistor-like configuration

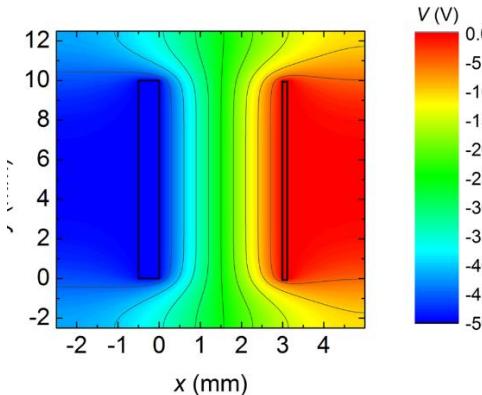

ONSET $\Delta V = -10$ V

Cyclable ($\sim 10^2$ cycles)

Capacitor configuration

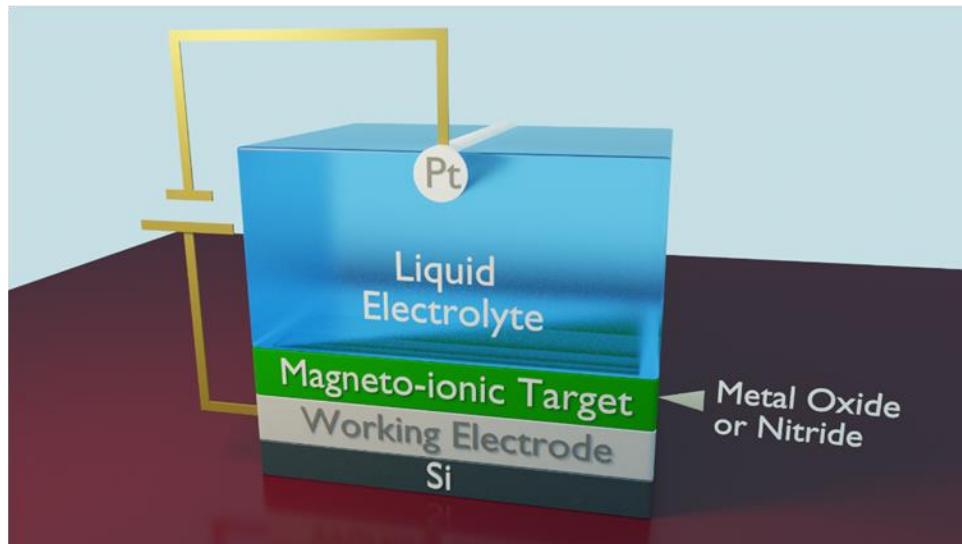

ONSET $\Delta V = -4$ V

Cyclable ($\sim 10^2$ cycles)

3. RESULTS AND DISCUSSION: What about **nitrogen magneto-ionics**?

- Paramagnetic CoN by reactive sputtering
- Interstitial N (expanded austenite)
- Ionic radius N (-III) = 132 pm > Ionic radius O (-II) = 124 pm
- CoN: $a = 4.2840 \text{ \AA}$ (PDF®: 00-016-0116) vs. Co_3O_4 : $a = 8.0840 \text{ \AA}$ (PDF®: 00-009-0418)
- N is less electronegative than O & $E_{\text{Cohesion}} (\text{Co nitrides}) < E_{\text{Cohesion}} (\text{Co oxides}) \rightarrow \text{Co-N bonds weaker than Co-O bonds}$

Voltage actuation by **electrolyte-gating** (non-aqueous propylene carbonate with Na^+) using a capacitor configuration

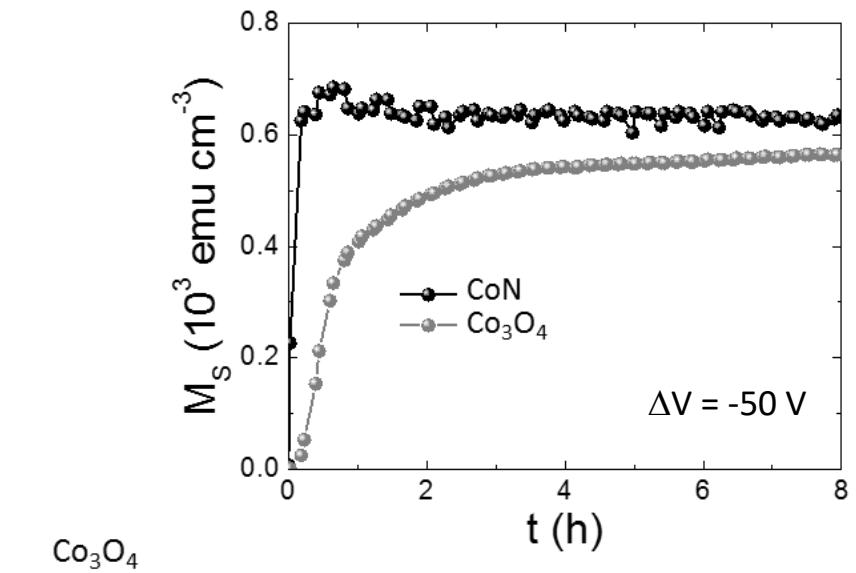

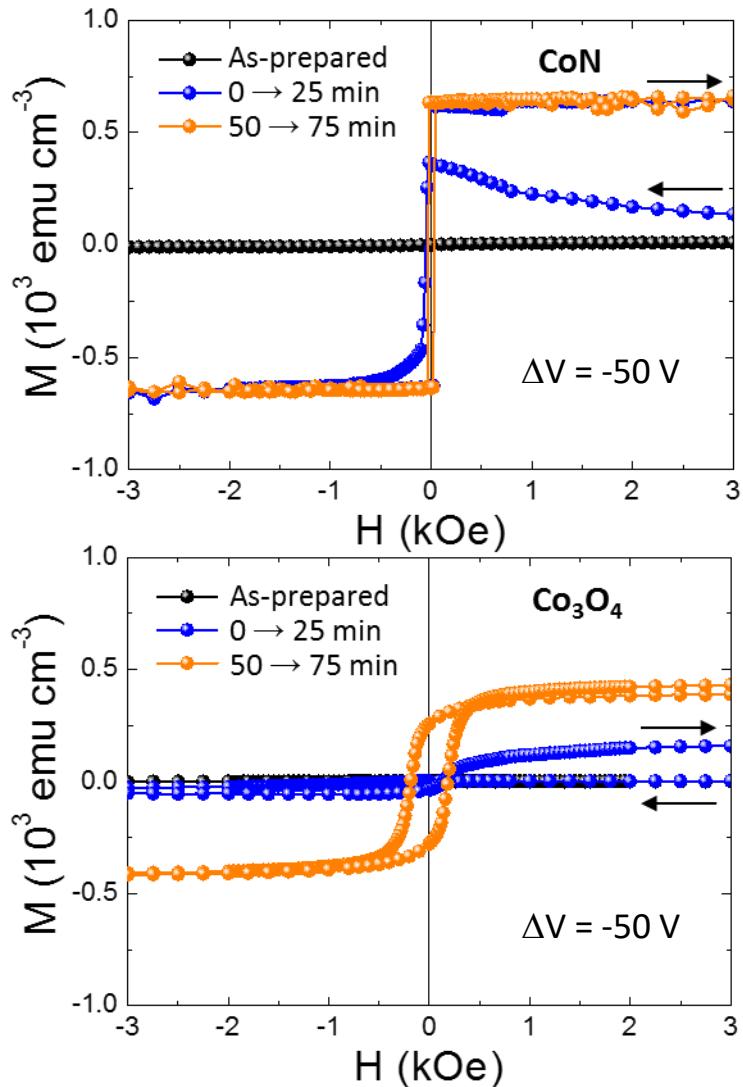

N vs. O magneto-ionics
(CoN vs. Co_3O_4)

(working electrolyte: Ti/Cu seed layer)

Nat. Commun. 11 (2020) 5871

3. RESULTS AND DISCUSSION: What about nitrogen magneto-ionics?

Ion motion rate $\approx 470 \text{ emu cm}^{-3} \text{ h}^{-1}$

$M_s (t \rightarrow \infty) \approx 590 \text{ emu cm}^{-3}$

ONSET $\Delta V = -6 \text{ V}$

Cyclable ($\sim 10^2$ cycles)

CoN

Ion motion rate $\approx 2600 \text{ emu cm}^{-3} \text{ h}^{-1}$

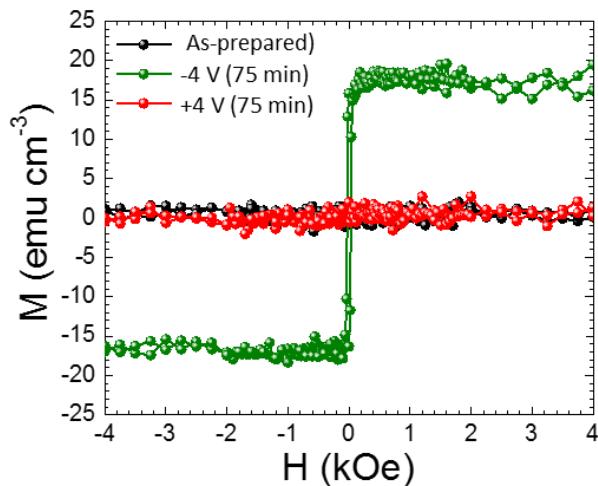

$M_s (t \rightarrow \infty) \approx 640 \text{ emu cm}^{-3}$

ONSET $\Delta V = -4 \text{ V}$

Cyclable ($\sim 10^2$ cycles)

N magneto-ionics as fast as Li-ion intercalation

3. RESULTS AND DISCUSSION: What about nitrogen magneto-ionics?

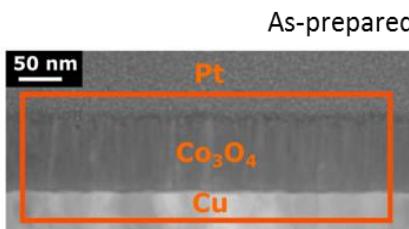

Magnetic switch

$\Delta V < 0$ Ferromagnetism

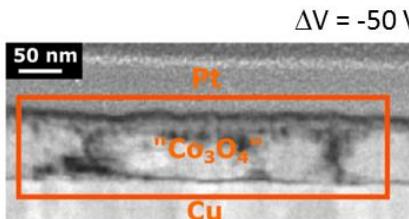

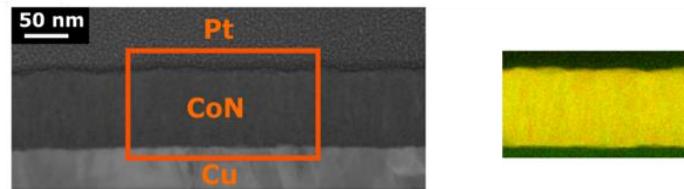

$\Delta V > 0$ Paramagnetism

Ion transport mechanisms (by electron energy loss spectroscopy)

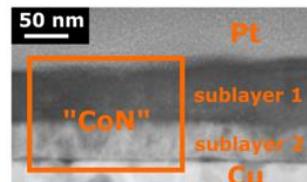

Co O N

As-prepared ($\Delta V = 0$ V)

O transport assisted by channels

N transport via a plane-wave-like migration front

3. CONCLUSIONS

4. CONCLUSIONS

- ✓ **ON-OFF ferromagnetism by O and N magneto-ionics (stable, tunable & reversible).**
- ✓ **The way to apply electric field is crucial to determine ion speed and generated magnetization (capacitor configuration better).**
- ✓ **N transport via plane-wave-like migration fronts while O transport is assisted by diffusion channels.**
- ✓ **N magneto-ionics shows lower ONSET voltages and enhanced ion motion.**
- ✓ **N magneto-ionics interesting to integrate this effect with other nitrides used in microelectronics.**
